5. EINBAU

5.1. Standort, Einbau und Lüftung

Die MIMO7272DN wurde speziell für die Unterbringung in 19"-Racks konstruiert, wo sie eine HE ausfüllt.

Da die MIMI4040DN Hitze erzeugt, ist es sehr wichtig, dass sie nicht vollkommen luftdicht aufgestellt und keinen extremen Temperaturen ausgesetzt wird. Es muss für freien Abzug der Luft aus den Lüftungsöffnungen des Gehäuses gesorgt werden, das heisst, unterhalb und oberhalb eines installierten Geräts muss jeweils eine HE des Racks freigelassen werden.

Hat die Anlage mehrere Verstärker im gleichen Rack oder ist sie in einem mit Türen verschlossenen Schrank eingebaut, so wird dringend empfohlen, eine nach oben abgeführte Zwangsbelüftung einzubauen, d.h., Ventilatoren unten und oben. Dieser nach oben fließende Lüftungsstrom begünstigt die Abführung der im Inneren des Racks oder Schrankes erzeugten Wärme.

5.2. Anschluss ans Stromnetz und Einschalten des Geräts

Die MIMO7272DN arbeitet mit Wechselspannung von 90 bis 264V und 47 bis 63Hz. Das Gerät besitzt ein überdimensioniertes Netzteil, das in der Lage ist, sich ohne zusätzliche Einstellungen weltweit an jedwede Netzspannung anzupassen.

An der Rückseite befindet sich beim Versorgungsanschluss nach IEC-Norm ein Schalter zum Ein- und Ausschalten des Geräts. An der Vorderseite befindet sich eine LED-Anzeige, die leuchtet, wenn das Gerät in Betrieb ist.

Um unerwünschte Brummgeräusche zu vermeiden, muss verhindert werden, dass sich das Netzkabel mit den abgeschirmten Kabeln, die das Audiosignal transportieren, vermischt oder parallel dazu verläuft.

5.3 Analoge Audioeingänge

Die MIMO7272DN verfügt an ihrer Rückseite über 8 analoge Signaleingänge (IN 1 bis 8), diese sind symmetrisch und lassen Line- und Microsignale zu. Die Auswahl der Signalart des Eingangssignals und seine Steuerung erfolgt über die Anwendung EclerNet Manager. Nähere Informationen hierzu finden Sie im Handbuch der Anwendung [EclerNet Manager](#).

Die Anschlüsse für den Signaleingang sind vom Typ Euroblock. Die Anschlüsse sind wie folgt zugewiesen:

Hot oder direktes Signal	>	Pin +
Cold oder phasenverkehrtes Signal	>	Pin -
Masse	>	Pin ⊥

Für asymmetrische Anschlüsse muss der -Pin mit Masse kurzgeschlossen werden.

5.4 Analoge Audioausgänge

Die MIMO7272DN verfügt an ihrer Rückseite über 8 analoge Signalausgänge (OUT 1 bis 8) sowie über 2 zusätzliche Monitorausgänge „MONITOR“; diese sind symmetrisch und mit Linepegel.

Die Anschlüsse für den Signalausgang sind vom Typ Euroblock. Die Anschlüsse sind wie folgt zugewiesen:

Hot oder direktes Signal	>	Pin +
Cold oder phasenverkehrtes Signal	>	Pin -
Masse	>	Pin ⊥

Für asymmetrische Anschlüsse den Pinout - nicht anschliessen.

5.5 Digitale DANTE™/AES67-Audioeingänge und DANTE™/AES67-Audioausgänge über IP

(Ports für Primär- und Sekundär-Netzwerke)

Die MIMO7272DN ermöglicht den Empfang von 64 digitalen DANTE™/AES67 Audiokanälen und die Sendung von 64 digitalen DANTE™/AES67 Audiokanälen über ein Ethernet-Netzwerk, das mit digitalem Audiotransport über IP mittels DANTE™/AES67-Protokoll kompatibel ist.

Das Routing der digitalen DANTE™/AES67-Audiosignale über das Ethernet-Netzwerk sowie die Netzwerkkonfiguration der DANTE™/AES67-Ports (IP-Adressen, Masken usw.) der MIMO7272DN werden über die Software-Anwendung Dante-Controller gesteuert. Nähere Informationen hierzu finden Sie in den Unterlagen des Entwicklers:

<https://www.audinate.com/products/software/dante-controller?lang=de>

Die MIMO7272DN hat an ihrer Rückseite zwei Anschlüsse mit RJ45-Schnittstelle zum Senden und Empfangen digitaler DANTE™/AES67-Audioinhalte. Diese sind als primär (PRIMARY) und sekundär (SECONDARY) beschriftet. Mit diesen beiden Ports kann die MIMO7272DN in zwei möglichen Betriebsarten arbeiten:

- Redundanter Betrieb:** Es existieren gleichzeitig zwei Netzwerkverbindungen (jede mit ihrer eigenen IP-Adresse, die sich von der der jeweils anderen Verbindung unterscheidet), d.h., die Ethernet-Pakete mit DANTE™/AES67-Informationen werden über beide Verbindungen übermittelt. Die beiden Ports (primär und sekundär) müssen an unterschiedliche lokale Ethernet-Netzwerke angeschlossen sein, diese können real oder virtuell (VLAN) sein und müssen richtig konfiguriert und gegeneinander isoliert werden. Die digitalen DANTE™/AES67-Audioinhalte werden somit über zwei unterschiedliche und voneinander unabhängige Wege gesendet und empfangen, ohne dass zwischen dem primären und dem sekundären Port eine Verbindung besteht. Sollte einer dieser beiden Wege ausfallen, so schaltet die MIMO7272DN automatisch auf den anderen Weg um und stellt so die Audioübertragung praktisch sofort wieder her. Es liegt auf der Hand, dass zur Erreichung einer totalen Redundanz alle zu einem System dieser Art gehörenden DANTE™/AES67-Geräte mit primärem und sekundärem DANTE™/AES67-Port ausgestattet sein müssen, und dass diese jeweils an die gleichen beiden unabhängigen Netzwerke angeschlossen sein müssen wie die MIMO7272DN.

Achtung: Sollten in dieser Betriebsart der primäre und der sekundäre Port (versehentlich) an ein und dasselbe Ethernet-Netzwerk angeschlossen werden, so hätte die Anwendung Dante Controller keinen Zugriff mehr auf die Steuerung der Netzwerk-Konfiguration und des DANTE™/AES67-Routings der Ports der MIMO7272DN. Der Zugriff auf die Steuerung wird wiedererlangt, sobald einer der beiden Ports von diesem Netzwerk getrennt wird.

Achtung: Die DANTE™/AES67-Redundanz erfordert, dass die primären und sekundären Ports aller angeschlossenen DANTE™/AES67-Geräte die gleiche Netzanschluss-Geschwindigkeit haben. Wird beispielsweise der Primärport mit einer Verbindung von 1 Gbps angeschlossen, so muss der Sekundärport ebenfalls eine Verbindung von 1 Gbps benutzen.

- **Schaltmodus (Switched):** In dieser Betriebsart steht eigentlich nur ein Netzwerkanschluss zur Verfügung (und somit nur eine IP-Adresse), und Primär- und Sekundärport verhalten sich wie zwei Ports, die zu einem in die MIMO7272DN integrierten Netzwerk-Switch gehören, und an die Geräte, die zum DANTE™/AES67-Netzwerk des Systems gehören, oder aber Ethernet-Switches, die Teil der Infrastruktur dieses Netzwerkes sind, direkt angeschlossen werden können.

Achtung: in dieser Betriebsart dürfen niemals beide Ports, also der primäre und der sekundäre, gleichzeitig an ein Netzwerk-Switch angeschlossen werden, denn dadurch würde eine Netzwerk-Schleife entstehen, die zu Konflikten im Netz führen und den digitalen DANTE™/AES67-Audioverkehr unterbrechen würde.

5.6 Ethernet-Port für Programmierung und Steuerung

Der mit ETHERNET beschriftete RJ45-Anschluss erlaubt den Anschluss des Geräts an ein lokales Ethernet-Netzwerk (LAN) und ist für folgende Zwecke geeignet:

- Steuerung von der Anwendung EclerNet Manager aus über direkten Anschluss (Kabel der Kategorie CAT5 oder höher) eines Rechners an eine MIMO7272DN oder aber durch Nutzung eines Ethernet-Netzwerkes als Verbindung zwischen beiden Geräten. Nähere Informationen hierzu finden Sie im Handbuch der Anwendung [EclerNet Manager](#).
- Anschluss an Steuergeräte von Drittanbietern (Crestron, AMX, Vity, Medialon, usw., vom jeweiligen Hersteller eingetragene Marken). Angewandtes Protokoll: Ecler TP-NET Nähere Informationen finden [Sie im Kapitel TP-NET-Protokoll](#).
- UCP: Fernsteuerung von EclerNet-Projekten über benutzerdefinierbare grafische Bedienfelder. Die MIMO7272DN kann als Server dieser in EclerNet-Projekte integrierten Bedienfelder agieren, oder auch per Fernbedienung über Client-Geräte von UCP-Bedienfeldern (WPNETTOUCH, mobile Android®- oder iOS®-Geräte, Windows®-Geräte usw.) gesteuert werden.

5.6.1 Werkseitig voreingestellte Netzwerkparameter

Die werkseitigen Standard-Netzwerkeinstellungen für kompatible Geräte mit EclerNet Manager sind folgende:

- IP: 192.168.0.100
- Mask: 255.255.255.0
- Gate: 192.168.0.1
- UDP Port: 2210

5.7 RS-232-Port zur Fernbedienung

Der an der Geräterückseite integrierte RS-232-Port mit integriertem DB9-Anschluss ermöglicht die Kommunikation eines externen Geräts mit einer MIMO7272DN über seriellen Anschluss. Dieser Anschluss verwendet die Syntax des TP-NET-Protokolls, damit das externe Gerät den Wert einiger der Parameter der MIMO7272DN übernehmen (über "GET"-Befehle) und/oder solche Werte ändern kann (über "SET"-Befehle). Nähere Informationen finden [Sie im Kapitel TP-NET-Protokoll](#).

Der serielle Anschluss muss folgende Merkmale erfüllen:

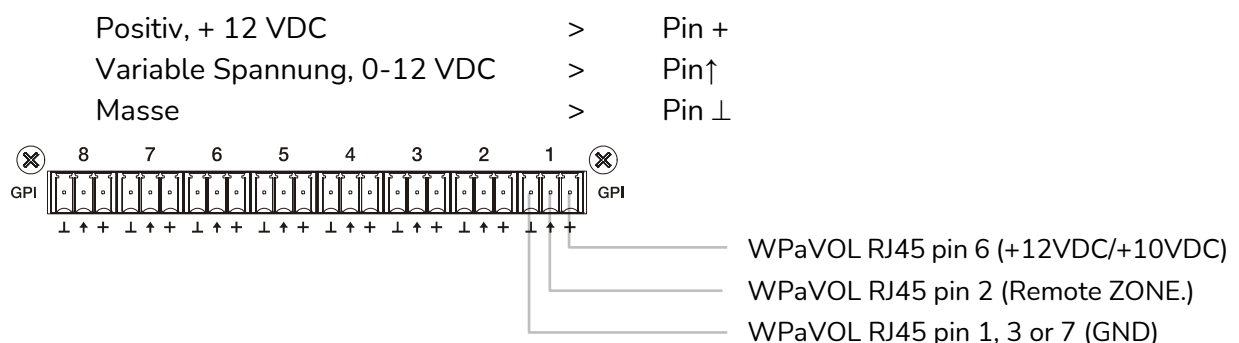

- Baud rate: 115200 (fixed, no auto negotiation)
- Data bits: 8
- Parity: None
- Stop bits: 1
- Flow control: None

5.8 GPI-Ports für Fernsteuerung

Die MIMO7272DN verfügt an ihrer Rückseite über 8 GPI-Eingänge, die über Gleichstrom von 0 bis 10 VDC angesteuert werden. Jeder dieser Eingänge kann an ein reales externes Gerät angeschlossen (Potentiometer, Kontaktschluss, variable Gleichspannung 0-10V usw.) und einer Funktion der MIMO7272DN zugewiesen werden, zum Beispiel:

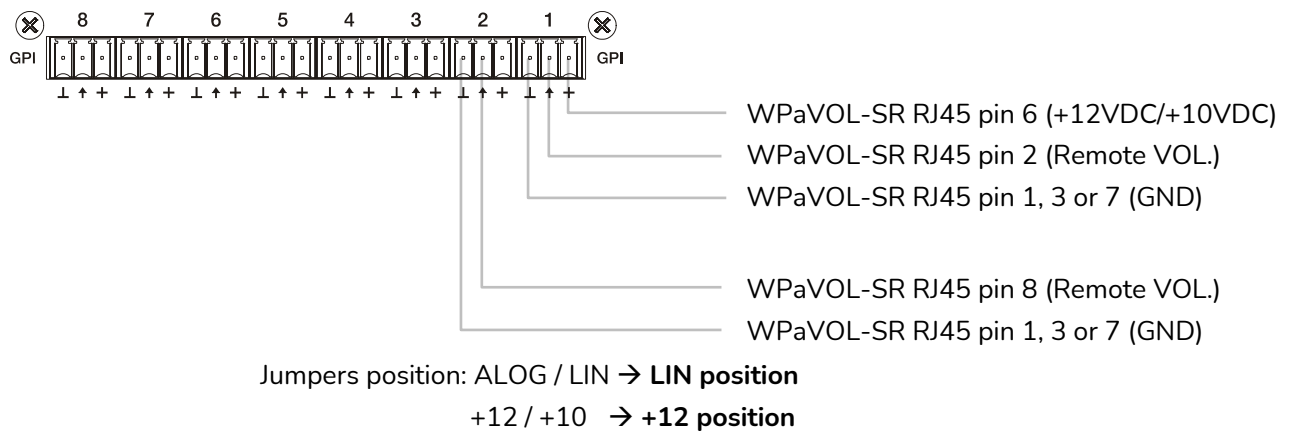

- Einstellung der Lautstärke eines Ein- oder Ausgangskanals oder eines Kreuzungspunkts der Audiomatrix über ein reales Potentiometer oder über ein Fernbedienungs-Gerät aus der Baureihe WPa von Ecler
- Aktivierung / Deaktivierung eines MUTE oder SOLO mittels Taster oder Kontaktschluss
- Aufruf eines Presets mittels Taster oder Kontaktschluss

Die GPI-Anschlüsse sind vom Typ Euroblock. Die Anschlüsse sind wie folgt zugewiesen:

Jumpers position: ALOG / LIN → **LIN position**
 +12 / +10 → **+12 position**

Anschluss WPaVOL an seriellen MIMO-GPI-Ports

Anschluss WPaVOL-SR an seriellen MIMO-GPI-Ports

Die Anschlusskabel können bis zu ca. 500 Meter lang sein, wenn ein Querschnitt von mindestens 0,5 mm² verwendet wird.

Erkundigen Sie sich bei Ihrem ECLER-Händler oder auf www.ecler.com über die Wandgeräte zur Fernbedienung aus der Baureihe WPa und über alles weitere Zubehör für den Anschluss an REMOTE-/VCA-Ports.

5.9 GPO-Ports für Fernsteuerung

Die MIMO7272DN verfügt an ihrer Rückseite über 8 Relaisausgänge NO/NC (normal open / normal closed). Jeder dieser Ausgänge kann durch Auslösen einer bestimmten, zuvor im EclerNet Manager programmierten Funktion, zum Beispiel ein Kalenderereignis oder das Drücken einer Taste des UCP-Bedienpanels, seinen Zustand ändern. Auf diese Weise ist das Zusammenspiel mit externen Geräten möglich, z.B. mit Antrieben von Projektionswänden oder beweglichen Trennwänden, mit Lichtern, Sirenen, GPI-Eingängen anderer Geräte usw.

6. ZU BEACHTENDE PUNKTE

6.1. Masseschleifen

Es ist stets darauf zu achten, dass die an der Matrix ankommenden Signalquellen sowie die Massen der Apparate, die an deren Ausgänge angeschlossen sind, getrennt sind, so dass ein Gerät nie mehr als einen Masseweg besitzt. Wäre dies der Fall, so könnte es zu unerwünschten Brummgeräuschen kommen, die sogar die Qualität der Klangwiedergabe beeinträchtigen könnten.

Sollten die Kabelabschirmungen mit dem Gehäuse verbunden sein, so dürfen sie auf keinen Fall untereinander verbunden sein. Auf diese Weise wird eine Bildung von Masseschleifen verhindert.

6.2. Hintergrundrauschen

Die MIMO7272DN wurde unter dem Gesichtspunkt der weitestgehenden Vermeidung von Hintergrundrauschen konzipiert. Allerdings hängt das Hintergrundrauschen, unabhängig vom elektronischen Konzept, unmittelbar von der richtigen Handhabung und Installation des Geräts ab.

Es ist zum Beispiel nicht das Gleiche, ob der GAIN-Regler eines Kanals auf 2 steht und der Pegelregler VOL des entsprechenden Ausgangs auf Maximallautstärke (Fall 1), oder ob das Gain des Eingangssignals richtig eingestellt ist und der Pegelregler der entsprechenden Ausgangskanäle auf einer mittleren Position steht (Fall 2). Im ersten Fall ist das Signal, das am Mix-Verstärker ankommt und von Natur aus ein eigenes Hintergrundrauschen besitzt, schwach, wodurch das Verhältnis Signal/Rauschen niedrig ist (wenig Signal). Verstärkt nun der Ausgangsverstärker alles gleichermaßen, so haben wir am Ausgang ein sehr starkes Hintergrundrauschen.

Im zweiten Fall, bei dem das Eingangs-Gain richtig eingestellt ist, empfängt die Matrix ein starkes Signal und somit auch ein starkes Verhältnis Signal/Rauschen, so dass das Signal, wenn es an den Ausgangskanälen ankommt und verstärkt wird, ein besseres Verhältnis aufweist als im ersten Fall.

12. TP-NET PROTOCOL INTRODUCTION

The TP-NET protocol lets a client device (control device) get and/or set the values of several parameters of the **EclerNet compatible devices** (MIMO and MIMO SG series digital matrices, DUO-NET PLAYER, NXA digital audio manager series, NZA amplifier series, NPA amplifier series, etc.), like volumes, mutes, alarms, etc. It's as well available for **eMIMO1616 digital matrix**, **HUB series digital zoner**, **MIMO7272DN** and **MIMO4040CDN digital matrix**.

The communication with these digital audio devices can be established using Ethernet and the UDP/IP transport protocol, always by means of the **5800** UDP port.

A second option for this communication is using the RS-232 interface that some of these compatible devices do also have (MIMO series, DUO-NET PLAYER, NXA series, etc.). In this case, the serial connection must fulfil the following specifications:

1. Baud rate: **57600** (fixed, no autonegotiation) for all the devices, except for DUO-NET PLAYER, eMIMO1616, HUB series and MIMO4040CDN, which use **115200** baud rate)
2. Data bits: 8
3. Parity: None
4. Stop bits: 1
5. Flow control: None

In case the Ecler device has an Euroblock connector for the RS-232 interface, the serial cable wiring, from the device's connector to a standard DB9 serial interface connector, must be the following:

WIRING RS232 – DB9	
RS232	DB9
Tx	Pin 2 (RxD)
Rx	Pin 3 (TxD)
Gnd	Pin 5 (Signal Gnd)

The protocol is simple and direct, making it easy to read, write and modify the generated code. It is based on messages with no begin and end delimiter: each message is self-delimited by the UDP packet size, which is defined with a maximum of **80 characters**. All the messages must be written in capital letters.

To let some control systems (like CRESTRON®, EXTRON®, AMX®, RTI®, VITY®, MEDIALON®, etc.) process the messages more easily, the EclerNet device adds the character **LF (0x0A)** to the end of each message. This way the client can buffer the

messages to process them, if it's required. The EclerNet device can also handle several messages received in a single message packet by using the **LF** delimiter.

The available messages are built with one or more fields separated with blank spaces (= blank space):

<TYPE> [PARAM1] [PARAM2] [PARAM3] [PARAM4][LF]

The first field (**TYPE**) defines the **message type** and then, the required parameters for it (each kind of message requires a given number of parameters). The field **TYPE** can have these values:

- 6. **SYSTEM**
- 7. **GET**
- 8. **SET**
- 9. **INC**
- 10. **DEC**
- 11. **SUBSCRIBE**
- 12. **UNSUBSCRIBE**
- 13. **DATA**
- 14. **ERROR**

At the end of this document you'll find all the available messages and their parameters for each model of the EclerNet compatible devices.

The **SYSTEM**, **GET**, **SET**, **INC**, **DEC**, **SUBSCRIBE** & **UNSUBSCRIBE** messages can be sent from the client to the EclerNet device. The **DATA** & **ERROR** messages can be sent from the device to the client. The only exception is the **SYSTEM PING** message, that is a **SYSTEM** type message that is sent from the EclerNet device when the initial message from the client to the device was **SYSTEM CONNECT PINGPONG**.

The communication (using UDP or RS-232) starts when a client sends the message **SYSTEM CONNECT** to the EclerNet device. As far as the UDP communication requires no connection (unlike the TCP), the EclerNet device stores this client's IP address, and then uses it as the destination IP address for the messages that it generates (**DATA** & **ERROR**). After receiving the **SYSTEM CONNECT** message, the device dumps its entire configuration using several consecutive **DATA** messages.

The communication can be terminated by two methods:

15. **Manually:** when the client sends the **SYSTEM DISCONNECT** message, cancelling all the subscriptions and stopping the **DATA & ERROR** messages
16. **Automatically:** in case the initial message was **SYSTEM CONNECT PINGPONG** and the client didn't get any **SYSTEM PONG** message in a period longer than 10 seconds (presuming a communication breakdown)

The **SET** messages don't have an automatic acknowledgement with a **DATA** message sent from the EclerNet device after it has processed the **SET** command. The client must update the values itself and must send the needed **GET** message if it requires confirmation from the device.

NOTES:

17. The numerical values are always integer numbers without +, -, comma or dot symbols.
18. **[PINGPONG]** is an optional parameter used to configure the device-client communication with a periodical check, to see whether the client or the device have terminated it. When configured this way, the device sends a **SYSTEM PING** once per second, and the client must answer with a **SYSTEM PONG** message. If anyone doesn't get these messages along a 10 seconds period, the communication will be considered terminated
19. **<Input Channel>** & **<Output Channel>** are numerical values that identify an input or output channel of the EclerNet device:
20. It can be within a [1..8] range for MIMO88 single units (8x8 matrix masters), and [1..16] for MIMO88 couples configured as 16x16 matrix masters
21. It can be within a [1..8] range for MIMO88SG units
22. It can be within a [1..12] range for MIMO1212SG units
23. For the NPA series, **<Output Channel>** can be within a [1..2] range
24. For the NXA and NZA series it can be within the [1..4] or [1..6] range, for 4 or 6 channel amplifiers
25. It can be within a [1..16] range for eMIMO1616 units
26. It can be within a [1..40] range for MIMO7272DN and MIMO4040CDN
27. **<Preset Number>** is a numerical value that identifies one available Preset stored in the EclerNet device's memory:
28. For the MIMO series it can be within the [1..99] range
29. For the DUO-NET PLAYER it can be within the [1..20] range
30. For the NPA series it can be within the [1..10] range

32. **<Level>**, **<Pre Vumeter Level>** y **<Post Vumeter Level>** are numerical values in the [0..100] range that define values in a scale equivalent to [-inf..0] dB

33. **<GPI>** & **<GPO>** are numerical values within the [1..8] range for the MIMO88 configured as 8x8 matrix masters (single units), and [1..16] for MIMO88 couples configured as 16x16 matrix masters. For the NXA series GPI values can be within the [1..4] or [1..6] range, depending on model. For the MIMO7272DN and MIMO4040CDN GPI and GPO values can be within [1..8]
34. **<GPI Value>** is a numerical value within the [0..100] range that indicates the value of an analogue GPI input. For a digital input only 0 or 100 are the possible values
35. **<GPO Value>** is a numerical value within the [0..1] range: it can only be 0 or 1 (opened or closed GPO)
36. **<Rate>** is a numerical value within the [1..10] range that sets the VU-meter refresh rate, or the number of times the vumeters' values are sent per second (by default = 3)
37. **"<Device Name>"** is the device name inside double quotation marks, to allow for names with blank spaces
38. **<Error ID>** is a numerical value for an error code
